Practical - 7

PHP Form Processing with Server-Side Validation and CSV/JSON File Storage

A . Theory

Process submitted registration/contact form data using PHP. Validate and sanitize inputs on the server side and store records in CSV or JSON file format. Display success/error messages.

1. **Is the form submitted using POST?**
   Yes. The form uses the P0ST method to send the entered data to the PHP file securely without showing the data in the URL.
2. **Are inputs validated and sanitized server side?**
   Yes. The PHP code checks whether the input is valid and uses sanitization methods to remove unwanted or unsafe characters before storing the data.
3. **Is file writing handled safely?**
   Yes. The PHP program checks the file before writing and uses proper file-handling methods. It also makes sure that the data is stored correctly without overwriting existing records.
4. **Are success and error responses displayed clearly?**
   Yes. After submission, a clear **success message** is shown when the data is saved successfully. If something goes wrong, an **error message** is displayed so the user knows that the submission was not successful.

B. Implementation/ Output/Result

Here is my GitHub repo link the codes are here in repo:

E. Challenges Faced:

While doing this practical, I faced some difficulties in connecting the HTML form with PHP and handling the form data using the POST method. I also had some problems while saving the submitted data into the Excel file and setting the correct file permissions. Understanding validation, file handling and displaying success or error messages was also a little difficult at first. After fixing the errors and testing the form, I understood how PHP processes and stores form data.

F. Learning Outcomes:

In this practical, I learned how to connect an HTML form with PHP and receive form data using the POST method. I learned how to validate user inputs and store the submitted data in a file. I also understood basic file handling and how to display success and error messages to the user. Overall, this practical helped me understand how a website can take user input and process it on the server side.
