Practical - 11

Student Management CRUD with Search and Filter

A . Theory

Create a student management module to add, view, edit, delete, search and filter student records. All database operations must use MYSQLi statements and clear success/failure messages.

1. Are SELECT, INSERT, UPDATE, and DELETE operations working? Yes, all four database operations are working. I can view records, add new records, update existing details, and delete records from the database.

2. Is search by name/email/course implemented? Yes, the search functionality allows me to find student records using their name, email, or course, making it easier to manage student data.

3. Are delete operations confirmed before execution? Yes, a confirmation message is displayed before deleting a record to avoid accidental deletion of student data.

B. Implementation/ Output/Result

Here is my GitHub repo link the codes are here in repo:
https://github.com/dhyaani19/StudentHub-Portal.git

C.. Evidence of Work (Screenshots)

E. Challenges Faced:

During this practical, I faced some difficulties in connecting the student management module with the MySQL database and performing operations correctly. I had to understand how to add new student records, update existing details, and delete records without affecting other data. Implementing the search and filter options was also a little challenging. I tested different inputs and fixed the errors to make the module work properly.

F. Learning Outcomes:

Through this practical, I learned how to create a student management system using PHP and MySQLi. I understood how to perform CRUD operations, including adding, viewing, updating, and deleting student records. I also learned how to search and filter student details and display appropriate success or error messages after each operation. This practical helped me understand how database operations are used in real-world applications.
