Practical - 1

Practical Title: Project Initiation, Requirement Analysis, Sitemap, Wireframe, and GitHub Setup

Problem Definition: Initiate the semester-long StudentHub portal by identifying the problem scope, user roles, key modules, navigation flow, and minimum 10 pages. Create a sitemap, low-fidelity wireframe, project folder structure, README file, and GitHub repository.

A. Theory

1. What is URL and parts of URL?

Answer: A URL (Uniform Resource Locator) is a unique address used to locate and access resources on the internet. It Identifies the location of a resource and specifies protocol http or https with ip address. URL can contain the path to reach to the resorces like files, web pages, images .web sites etc.

Parts of URL:

1.Scheme: Defines the protocol used to access the resource (e.g., http, https, ftp).
2.Domain: Identifies the main website name (e.g., example).
3.Top-Level Domain (TLD): Indicates the domain extension (e.g., .com, .org).
4.Port Number: Specifies the server port (default: 80 for HTTP, 443 for HTTPS).
5.Path: Points to the resource location on the server.

2. How does HTML file process in web browser?

Answer: HTML file processing in a web browser starts when the user enters a website URL or opens an HTML file. The browser sends a request to the web server, and the server returns the HTML file. The browser reads and processes the HTML code, then loads other required files such as CSS, JavaScript, images, and videos. After processing all the content, the browser displays the complete web page on the screen so the user can view and interact with it.

3. How will page navigation flow managed among all HTML pages?

Answer: Page navigation flow among HTML pages is managed using hyperlinks created with the `<a>` (anchor) tag. Each page contains links that connect to other HTML pages using their file names or URLs. When a user clicks a link, the browser loads the corresponding page. This allows users to move easily between the Home, About, Contact, and other pages of the website, creating a smooth navigation flow.

4. How will GitHub commits be maintained after each practical?
Answer:GitHub commits will be maintained by creating a new commit after completing each practical. Every commit will include the changes made in that practical along with a clear commit message, such as "Added Practical 1" or "Completed Practical 2". This helps keep track of progress, maintain version history, and makes it easy to review or restore previous changes if needed.

B. Implementation/ Output/Result

Here is my GitHub repo link the codes are here in repo: https://github.com/dhyaani19/StudentHub-Portal.git

C. Evidence of Work (Screenshots). -Figure 1.1 Home page

E. Challenges Faced:

Initially I want able to use html tags and faced difficulties to make wire frames

F. Learning Outcomes:

I learned about sitemaps and wireframes ,How to design wireframes ,learned the tool Figma to create wireframes and learned basics about html how to insert a paragraph how to colour it ,learned to add text boxes ,radio buttons , checkboxes etc

Faculty Remarks:
