Practical - 14

Admin Dashboard with Role-Based Access Control, Dynamic Menu, and Audit Log

A . Theory

Develop an admin dashboard that displays user statistics, student count, event count and latest registrations. Restrict access to admin users onlyand show dynamic menu options based on role.

1. Are dashboard values loaded dynamically from the database? Yes, dashboard values are fetched dynamically from the database, so the admin can view updated information about students, events, and other records.

2. Is access restricted to admin users? Yes, access to the admin dashboard is restricted to authorized admin users. Other users cannot access it without the required permissions.

3. Are role-based menus working? Yes, menus are displayed according to the user's role. Admin users can access management features, while students can access their permitted options.

4. Are important admin actions recorded in `audit_logs`? Important admin actions are recorded in the `audit_logs` table to maintain a record of activities and make them easier to track.

B. Implementation/ Output/Result

Here is my GitHub repo link the codes are here in repo:
https://github.com/dhyaani19/StudentHub-Portal.git

C.. Evidence of Work (Screenshots)

E. Challenges Faced:

During this practical, I faced some difficulties in displaying dashboard statistics dynamically from the database and showing the latest student registrations. I also had to understand how to restrict dashboard access to admin users and display different menu options according to the user's role. Recording important admin activities in the audit log was another challenging part. By testing different features, I learned how to handle these issues and improve the functionality of the dashboard.

F. Learning Outcomes:

Through this practical, I learned how to create an admin dashboard using PHP and MySQLi. I understood how to display student counts, event counts, user statistics, and recent registrations dynamically from the database. I also learned how to

implement role-based access control, display menu options according to user roles, and maintain audit logs to track important admin activities. This practical helped me understand how an admin panel works in a real-world web application.

Faculty Remarks:
