Practical - 3

Practical Title: Responsive UI Design using CSS Grid, Flexbox, and Bootstrap/Tailwind

A . Theory

Design responsive layouts for Home, About, Registration, Dashboard, and Events pages using CSS Grid and Flexbox. Optional to use CSS framework such as Bootstrap or Tailwind. Ensure mobile-first responsiveness.

1. How does the layout adapt for mobile, tablet, and desktop screens?

The layout is made responsive using CSS media queries. On desktop, the content has more space, while on tablet and mobile, the content adjusts to fit the smaller screen. Navigation and other elements can also change their size or position according to the screen width.

2. Which layout technique is used and why?

Flexbox is used for arranging the elements. It makes it easier to align and organize the content and also helps the layout adjust properly on different screen sizes.

3. Are typography, spacing, colors, and contrast readable?

Yes, the font size and spacing are kept simple and readable. The colors have enough contrast between the text and background, so the content is easy to read. Proper spacing is also used to avoid making the page look crowded.

4. Is the framework used consistently without unnecessary inline CSS?

Yes, the styling is kept in the external CSS file instead of using unnecessary inline CSS. This keeps the code clean and makes it easier to maintain and apply the same design to different pages.

B. Implementation/ Output/Result

Here is my GitHub repo link the codes are here in repo:
https://github.com/dhyaani19/StudentHub-Portal.git

Student Result

Name: Dhyani Hirenkumar Jadav

Enrollment No: 25DCE032

Semester: 3

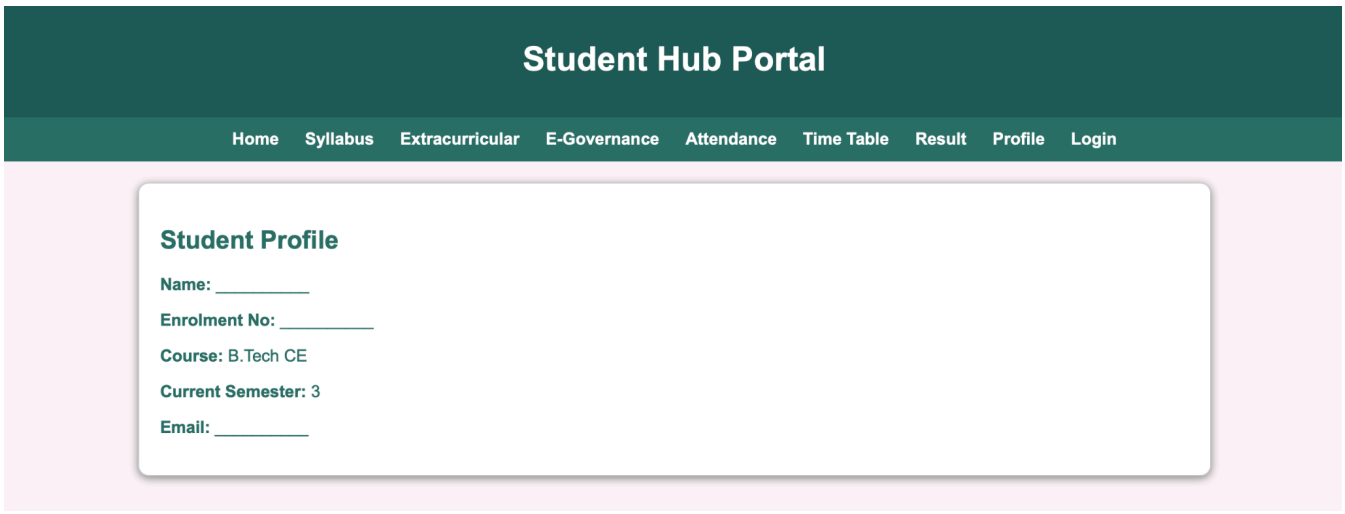

Marks

Subject	Marks	Grade
Mathematics	88	A
DSA	91	A+
Web Development	84	A
Java	89	A
Environmental Science	93	A+
Total	**445 / 500**	**89%**

Total SGPA: 7.5

Result Status: Pass

https://github.com/dhyaani19/StudentHub-Portal.git

E. Challenges Faced:

My css is not applying to the other pages it only applying on inde.html
Solution my pages folder is in another folder so that i move pages folder out and then give link like this - ../css/style.css

My navigation is showing in left side and it is very near with each element then i use display flex and align items at center and use gap =25px

F. Learning Outcomes:

1 we use div class =”cointner”
To make the element(code)t at a single place so giving css becomes easy In css part
2 we use font family do decide they our text can arial or any type
3 margin - it is for outer part of table where we can decide distance btw any two things
4 padding - using padding we can decide how much space we need btw the cell in table .
5 using display flex we can decide the distance btw two links in navigation bar
6 using text declaration we can remove lines in nav bar

Faculty Remarks:
